

Rethinking the Measurement of Demographic Differences in Outcome Rates

Methods Workshop,
Maryland Population Research Center
University of Maryland
College Park, Maryland
October 10, 2014

James P. Scanlan
Attorney at Law
Washington, DC
jpscanlan.com

This is a version of the workshop in essentially the form it was given on October 10, 2014. An annotated version may be found [here](#).

Personal background

- Lawyer in Washington, DC
- EEOC v. Sears, Roebuck and Co. (nationwide gender discrimination case tried over a ten-month period in 1984-85)
 - Milkman “[Women’s History and the Sears Case,](#)” *Feminist Studies* (1986)
 - [Sears Case](#) page of [jpscanlan.com](#)
 - [Sears Case Illustration](#) subpage of Scanlan’s Rule page
 - See Discrimination Issues section *infra*.

- Correct or Incorrect?
- If correct, how many appraisals of differences between outcome rates of two groups have been sound?

Outline (1)

- Four Key Points and Two Subsidiary Points (5)*
- References (15)
- Illustrations of Interpretative Rules 1 and 2 (IR1 & IR2) (20)
- Implications of and Corollaries to IR1 (41)
- Illustrations with Income/Poverty Data (57)
- Estimated Effect Size (EES) (63)
- NCHS Recognition of IR1 and Health Disparities Research Issues (72)

*Numbers in parentheses are page numbers of presentation as originally delivered. The will become inexact as explanatory pages are added to the online version.

Outline (2)

- **Discrimination Issues** (and Demonstration That There Is Only One Correct Answer Regarding Whether the Forces Causing Outcome Rates of Advantaged and Disadvantaged Groups to Differ Are Stronger in One Setting Than Another) (86)
- **Representational Comparison and Disproportionality Issues (95)**
- **Pay for Performance and Healthcare Disparities Issues (109)**
- **Educational Disparities Issues (114)**
- **Illustrations of Pernicious Implications of Notion That Each Standard Measure is Sound – From Alternative Perspective (116)**

Four Key Points and Two Subsidiary Points

Key Point 1

Standard measures of differences between outcome rates (proportions) cannot effectively quantify differences in the circumstances of advantaged and disadvantaged groups because – for reasons inherent in the underlying risk distributions – each measure tends to be systematically affected by the prevalence of an outcome.

- Relative (percentage) differences in a favorable outcome
- Relative differences in the corresponding adverse outcome
- Absolute (percentage point) differences
- Odds Ratios

Key Point 2

Efforts to appraise differences in the circumstances of two groups reflected by a pair of outcome rates in the law and the social and medical sciences have been almost universally undermined by failure to recognize the way chosen measures tend to be affected by the prevalence of an outcome.

Key Point 3

Even when broadly correct, research employing standard measures of differences between outcome rates is misleading by implying that the chosen measures effectively quantify the difference in circumstances of two groups reflected by their differing outcome rates.

Key Point 4

There exists only one answer to the question of whether differences in the circumstances of advantaged and disadvantaged groups reflected by their favorable or adverse outcome rates have increased or decreased over time or are otherwise larger in one setting than another.

That answer can be divined, albeit imperfectly, by deriving from pairs of outcome rates the difference between means of the underlying risk distributions.

Subsidiary Point 1

It is not possible to draw sound inferences about processes/forces based solely on information as to the proportion a group comprises of persons potentially experiencing an outcome and the proportion it comprises of persons actually experiencing the outcome (e.g., 20% of pool and 10% of selections).

One needs the actual rates at which each group experienced the outcome.

See Tables 22 and 23 *infra*.

Subsidiary Point 2

It is not possible to draw sound inferences about processes/forces based solely on examination of persons who accepted some outcome (e.g., persons accepting different jobs, persons accepting subprime versus prime loans).

Caveat One Regarding Key Points

- Do not be distracted by the fact that one commonly finds departures from the patterns described here. Observed patterns are invariably functions of
 - (a) the strength of the forces causing rates to differ and
 - (b) the prevalence-related/distributionally-driven forces described here.
- Society's interest is in (a).
- Only with a mastery of (b) can one understand (a).

Caveat Two Regarding Key Points

- Do not think that presenting relative and absolute differences (or even both of the two relative differences and the absolute difference) addresses the issues raised here.
- The fundamental problem is that none of the measures is statistically sound.

Clinical Settings

- Discussion here will largely focus in advantaged and disadvantaged groups.
- Points made apply equally in clinical setting where treated subjects are the advantaged group and control subjects are the disadvantaged group.
- See [Subgroup Effects](#) subpage of the [Scanlan's Rule](#) page.

Illustrations of Interpretive Rules 1 and 2

Table 1(a). Explanation of Terms with Respect to Four Measures of Differences Between Favorable or Adverse Outcome Rates of Advantaged Group (AG) and Disadvantaged Group (DG)

(a) AG Fav Rt	(b) DG Fav Rt	(1) AG/DG Ratio Fav
90%	80%	1.125

In this presentation, the larger figure is always used as the numerator in the rate ratio (RR); hence the relative difference is always $RR - 1$

$$(1) \text{ AG/DG Ratio Fav} = a/b \quad (1.125; \text{relative difference is } 12.5\%) - \text{BLUE}$$

Table 1(b). Explanation of Terms with Respect to Four Measures of Differences Between Favorable or Adverse Outcome Rates of Advantaged Group (AG) and Disadvantaged Group (DG)

(a) AG Fav Rt	(b) DG Fav Rt	(c) AG Adv Rt	(d) DG Adv Rt	(1) AG/DG Ratio Fav	(2) DG/AG Ratio Adv
90%	80%	10%	20%	1.125	2.00

In this presentation, the larger figure is always used as the numerator in the rate ratio (RR); hence the relative difference is always $RR - 1$

(1) AG/DG Ratio Fav = a/b (1.125; relative difference is 12.5%) - BLUE

(2) DG/AG Ratio Adv = d/c (2.00; relative difference is 100%) - RED

Table 1(c). Explanation of Terms with Respect to Four Measures of Differences Between Favorable or Adverse Outcome Rates of Advantaged Group (AG) and Disadvantaged Group (DG)

(a) AG Fav Rt	(b) DG Fav Rt	(c) AG Adv Rt	(d) DG Adv Rt	(1) AG/DG Ratio Fav	(2) DG/AG Ratio Adv	(3) Abs Df (pp)
90%	80%	10%	20%	1.125	2.00	10

In this presentation, the larger figure is always used as the numerator in the rate ratio (RR); hence the relative difference is always RR -1

(1) AG/DG Ratio Fav = a/b (1.125; relative difference is 12.5%) - BLUE

(2) DG/AG Ratio Adv = d/c (2.00; relative difference is 100%) - RED

(3) Abs Df (pp) = a-b (10 percentage points) - GREEN
 [see [Percentage Points](#) subpage of Vignettes page]

Table 1(d). Explanation of Terms with Respect to Four Measures of Differences Between Favorable or Adverse Outcome Rates of Advantaged Group (AG) and Disadvantaged Group (DG)

(a) AG Fav Rt	(b) DG Fav Rt	(c) AG Adv Rt	(d) DG Adv Rt	(1) AG/DG Ratio Fav	(2) DG/AG Ratio Adv	(3) Abs Df (pp)	(4) Odds Ratio
90%	80%	10%	20%	1.125	2.00	10	2.25

In this presentation, the larger figure is always used as the numerator in the rate ratio (RR); hence the relative difference is always RR -1

(1) AG/DG Ratio Fav = a/b (1.125; relative difference is 12.5%) - BLUE

(2) DG/AG Ratio Adv = d/c (2.00; relative difference is 100%) - RED

(3) Abs Df (pp) = $a-b$ (10 percentage points) - GREEN
 [see [Percentage Points](#) subpage of Vignettes page]

(4) Odd Ratio = $(a/c)/(d/b)$ (2.25)

Table 2 (a): Simplified Illustration of Effect of Lowering Test Cutoff on Relative Difference Between Pass Rates (numerator (non)issue explained)

AG Pass	DG Pass	AG/DG Ratio Pass	DG/AG Ratio Pass
80%	63%	1.27	.79

When larger figure is used in numerator or rate ratio, relative difference is RR – 1: Blue column shows that AG pass rate is 27% greater than DG pass rate.

When smaller figure is used as numerator in rate ratio, relative difference is 1 – RR: Yellow column indicates that DG pass rate is 21% less than AG pass rate.

Table 2 (b): Simplified Illustration of Effect of Lowering Test Cutoff on Relative Difference Between Pass Rates (numerator (non) issue explained)

Cutoff	AG Pass	DG Pass	AG/DG Ratio Pass	DG/AG Ratio Pass
High	80%	63%	1.27	.79
Low	95%	87%	1.09	.92

Regardless of which figure is used as the numerator, lowering cutoff reduces relative difference in pass rates. Either (a) from 27% to 9% (BLUE) or 21% or (b) from 21% to 8% (YELLOW).

YELLOW approach is that used in Four-Fifths Rule of Uniform Guidelines on Employee Selection Procedures which find adverse impact where DG success rate is less than 80% of AG success rate. At high cutoff, Four-Fifths Rule would rule be violated; at lower cutoff rule would not be violated. (See [Four-Fifths Rule](#) subpage of [Disparate Impact](#) page regarding the illogic of the rule, or any rate ratio as a measure of association.)

Table 3(a): Simplified Illustration of Effects of Lowering Test Cutoff on Relative Difference Between Pass Rates and Relative Difference Between Failure Rates

Cutoff	AG Pass	DG Pass	DG/AG Ratio Pass
High	80%	63%	1.27
Low	95%	87%	1.09

As a result of lowering the cutoff:

- (a) Rate ratio for passing decreased from 1.27 to 1.09 (i.e., relative difference between pass rates decreased from 27% to 9%)

Table 3(b): Simplified Illustration of Effects of Lowering Test Cutoff on Relative Difference Between Pass Rates and Relative Difference Between Failure Rates

Cutoff	AG Pass	DG Pass	AG Fail	DG Pass	DG/AG Ratio Pass	DG/AG Ratio Fail
High	80%	63%	20%	37%	1.27	1.85
Low	95%	87%	5%	13%	1.09	2.60

As a result of lowering the cutoff:

- (a) Rate ratio for passing decreased from 1.27 to 1.09 (i.e., relative difference between pass rates **decreased** from 27% to 9%);
- (b) Rate ratio for failure increased from 1.85 to 2.60 (i.e., relative difference between pass rates **increased** from 85 percent to 160%).

Notes on Lowering Standards

- For years, federal agencies have been encouraging mortgage lenders and public schools to relax lending and discipline criteria under the mistaken belief that doing so will reduce relative (racial/ethnic) differences in adverse borrower/discipline outcomes.
- Federal agencies continue to monitor fairness of practices on the basis of relative differences in adverse outcomes.
- By responding to federal encouragements to relax standards, lenders and public schools increase the chances that the federal government will accuse them of discrimination.
- No agency of government is aware, in any institutional sense, that lowering a test cutoff tends to increase relative differences in failure rates (save, to a degree, NCHS, as will be discussed). Same holds for Congress and GAO.

Less Discriminatory Alternatives

- Most of the time when a disparate impact is measured in terms of the relative difference in adverse outcomes, what would commonly be the most obvious less discriminatory alternative (typically, relaxing some standard) will tend to increase the disparity.
- Whether relaxing a standard in fact reduces or increases a disparate impact (soundly measured) is a complex issue. See Section E of [Kansas Law workshop](#).

**Interpretive Rule 1 (IR1):
The Two Relative Differences
(aka Heuristic Rule X (HRX), [Scanlan's Rule](#))**

The rarer an outcome

- (a) the greater tends to be the relative difference in experiencing it and
- (b) the smaller tends to be the relative difference in avoiding it.

Fig. 1. Ratios of (1) DG Fail Rate to AG Fail Rate and (2) AG Pass Rate to DG Pass Rate at Various Cutoff Points Defined by AG Fail Rate

Absolute Differences/Odds Ratios

- Absolute differences and differences measured by odds ratios are unaffected by whether one examines the favorable or the adverse outcome.
- But for a measure to effectively quantify the strength of the forces causing outcome rates to differ it must remain constant when there occurs a change in overall prevalence akin to that effected by lowering a test cutoff.
- Absolute differences and odds ratios tend also to be affected by the prevalence of an outcome, but in a more complicate way than the two relative differences.

Interpretive Rule 2(IR 2): Absolute Differences/Odds Ratios

- As an outcome goes from being rare to being nearly universal, absolute differences between rates tend to:
 - (a) increase to the point where the first group's rate reaches 50%;
 - (b) behave inconsistently until the second group's rate reaches 50%;
 - (c) then decline.
- As the prevalence of an outcome changes, differences measured by odds ratios tend to change in the opposite direction of absolute differences.

Relationship of the Absolute Difference to the Two Relative Differences (1)

- As the prevalence of an outcome changes, the absolute difference tends to change in the same direction as the smaller relative difference.
- Since observers commonly focus on the larger relative difference, there is a systematic tendency for the absolute difference and the reported relative difference to change in opposite directions.

Table 4: Simplified Illustration of Effects of Lowering Test Cutoff on Relative Difference Between Pass Rates and Relative Differences Between Failure Rates (with absolute differences and odds ratios)

Cutoff	AG Pass	DG Pass	DG/AG Ratio Pass	DG/AG Ratio Fail	Abs Df (pp)	Odds Ratio
High	80%	63%	1.27	1.85	17	2.35
Low	95%	87%	1.09	2.60	8	2.84

Fig. 2: Absolute Difference Between Rates at Various Cutoffs Defined by AG Fail Rate

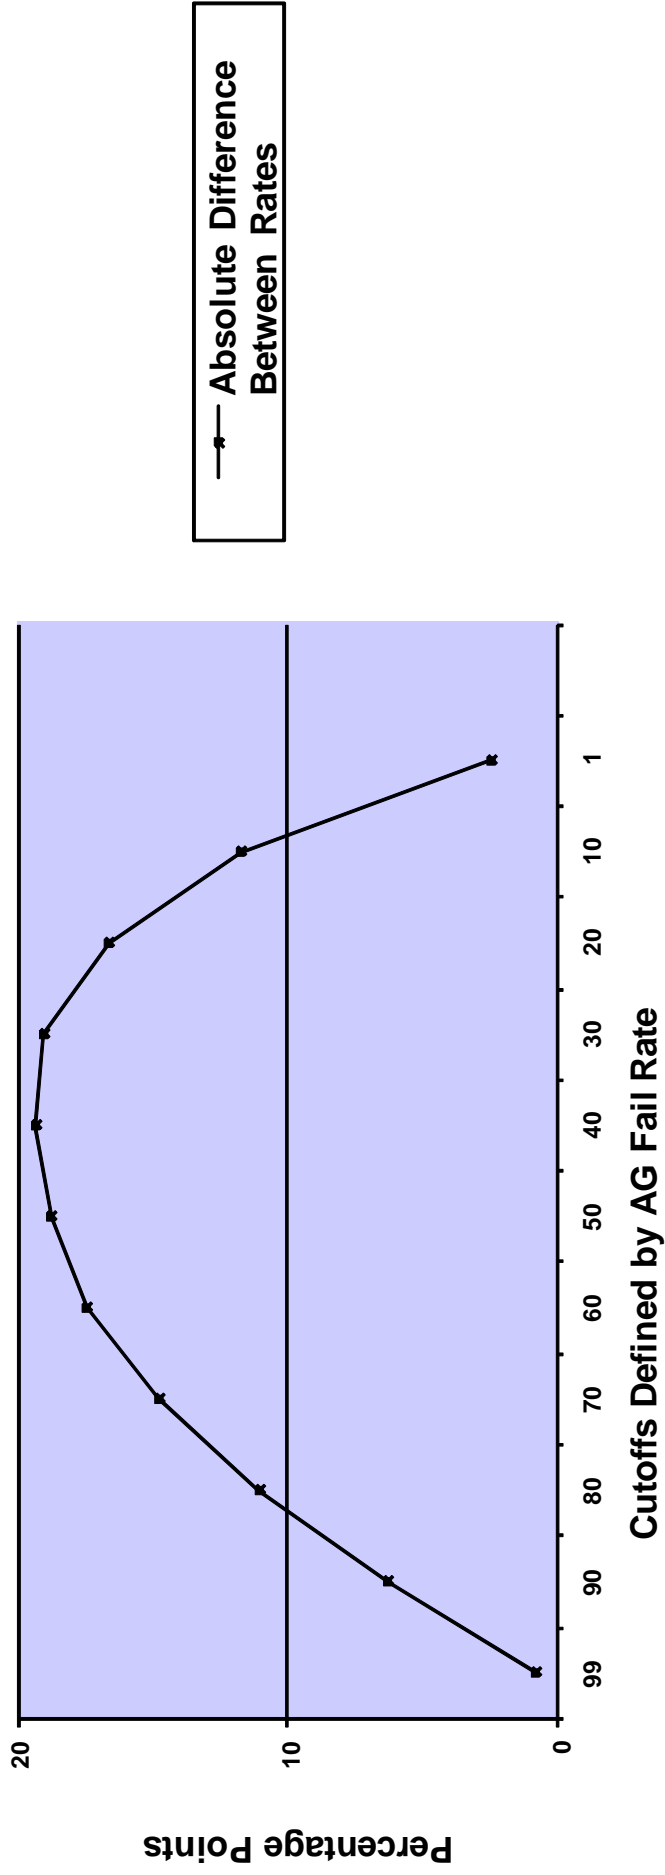

Fig. 3 Ratios of (1) DG Fail Rate to AG Fail Rate, (2) AG Pass Rate to DG Pass Rate, (3) DG Failure Odds to AG Failure Odds; and (4) Absolute Difference Between Rates

Implications of and Corollaries to Interpretive Rule 1

IR1 Implications – General

- As mortality and poverty decline, relative differences in experiencing those outcomes tend to increase while relative differences in avoiding them tend to decrease.
- As procedures like immunization and cancer screening become more common, relative differences in receipt of those procedures tend to decrease while relative differences in failing to receive them tend to increase.
- More survivable cancers tend to show larger relative differences in mortality, but smaller relative differences in survival than less survivable cancers. [Mortality and Survival](#) page and Table 17 *infra*.
- Generally reducing blood pressure (or improving folate levels) tends to increase relative differences in hypertension (or low folate) while reducing relative differences in normal blood pressure (or adequate folate). [NHANES Illustrations](#) subpage of SR.
- Relaxing mortgage lending, employment, or public school discipline standards tends to increase relative differences in failing to meet the standards while reducing relative differences in meeting the standards.

IR1 Implications – Comparatively Advantaged Populations/Subpopulations (1)

- Relative racial, gender, socioeconomic differences in adverse outcomes tend to be larger, while relative differences in the corresponding favorable outcomes tend to be smaller, among comparatively advantaged populations/subpopulations (where the outcomes are less common) than among less advantaged populations/subpopulations.

IR1 Implications – Comparatively Advantaged Populations/Subpopulations (2)

- Racial diff in infant health outcomes among highly-educated or low risk groups (“[Race and Mortality](#)”)
- Occupational diff in mortality among British Civil Servants ([Whitehall Studies](#))
- Racial, gender, and SES diff in mortality among young ([Life Tables Illustrations](#))
- Racial diff in loan rejection among high-income applicants ([Disp – High Income](#))
- Racial diff in completion/non-completion rates at elite universities (“[Race and Mortality](#)”)
- Suburban discipline disparities ([Suburban Disparities](#))
- Racial and SES diff in mortality in Norway and Sweden (or Minnesota and Massachusetts)

IR1 Implications – Comparatively Advantaged Populations/Subpopulations (3)

- Racial diff in adverse outcomes among high SES groups; SES differences in adverse outcomes among whites.
- Racial diff in healthcare among the insured compare with the uninsured.
- Racial and gender diff in selection among highly qualified applicants.
- Racial diff in suspensions in pre-school versus K12. Table 7 or Society 2014 and Table 11 *infra*.
- Effect of records on employment prospect of whites versus blacks (or effect of being black on employment prospects of those with or without criminal records). Table 8 of Society 2014 and Table 17 *infra*.

IR1 Implications – Comparatively Advantaged Populations/Subpopulations (4)

- Scholars describe patterns of large racial differences in adverse outcomes among advantaged subpopulations as “poorly understood.”
- It is fairer to say that they are not understood at all.
- Drawing of inferences based on perceptions about either (a) the large relative differences in adverse outcomes or (b) the small relative differences in favorable outcome within advantaged subpopulations has never been sound.

Table 5: Simplified Illustration of Effects of Patterns of the Two Relative Differences in Advantaged and Disadvantaged Setting

Setting	AG Pass	DG Pass	AG Fail	DG Pass	DG/AG Ratio Pass	DG/AG Ratio Fail
Disadvantaged (e.g., inner city)	80%	63%	20%	37%	1.27	1.85
Advantaged (e.g., suburbs)	95%	87%	5%	13%	1.09	2.60

Advantaged setting has larger difference in failure rates but smaller difference in pass rates.

Fig. 4. Black and White Rate of Bad Health and Lowest Income Categories
Bad Health and for Highest and Lowest Income Categories
(from Fig. 8 of Commissioned Paper discussed in Harvard letters)

Fig. 5. Black and White Rate of Bad and Good Health and Good Health and Black/White Rate Ratios for Bad Health and White/Black Rate Ratios for Good Health for Highest and Lowest Income Categories

Corollary 1 to IR1

As an outcome changes in overall prevalence,

- (a) the group with the lower baseline outcome rate will tend to undergo a larger proportionate change in its rate for the outcome, while
- (b) other group will tend to undergo a larger proportionate change in its rate for the opposite outcome.

Table 6: Simplified Illustration of Effects of Lowering Test Cutoff on Relative Difference Between Pass Rates and Relative Difference Between Failure Rates (with IR1 Corollary)

Cutoff	AG Pass	DG Pass	AG Fail	DG Pass	DG/AG	
					Ratio Pass	Ratio Fail
High	80%	63%	20%	37%	1.27	1.85
Low	95%	87%	5%	13%	1.09	2.60

Corollary 1: Lowering the cutoff caused:

- (a) pass rates to increase by 38% for DG but only 19% for AG;
- (b) failure rates to decrease by 75% for AG but only 65% for DG.

Implications of Corollary 1 to IR 1

- Effects of reductions/increases in poverty
- Effects of lowering/raising cutoffs (improving performance)
- Effects of improving health outcomes
- **Explanatory theories: “diffusion of innovation,” “inverse equity hypothesis” ([Explanatory Theories](#))***
- **Effects of chronic conditions on self-rated health* ([Reporting Heterogeneity, Comment on Delpierre BMC Pub Hlth 2012](#))**
- [Subgroup Effects](#) subpage of SR
- [Subgroup Effects – Nonclinical](#) subpage of SR

- [*Disproportionality in school discipline: An assessment of trends in Maryland, 2009-12*](#), Institute for Education Science (2014):

“Because rates of out-of-school suspension and expulsion decreased more rapidly for White students than for Black students, disproportionality between Black and White rates increased in 2011/12, the most recent year examined.”

“Statewide, students in special education were removed from school at more than twice the rate of other students. Even though the number of out-of-school suspensions and expulsions decreased for both groups over the three years, it decreased more slowly for students in special education than for other students.”

Corollary 2 to IR1

When an outcome declines in overall prevalence, there will tend to be an increase in the proportion the most susceptible group comprises of both

- (a) those experiencing the outcome; and
 - (b) those failing to experience the outcome.
- ([Feminization of Poverty, Table 1 of Chance 2006](#))

Table 7: Simplified Illustration of Effects of Lowering Test Cutoff on Relative Difference Between Pass Rates and Relative Difference Between Failure Rates (with IR1 corollaries 1 and 2)

Cutoff	AG Pass	DG Pass	AG Fail	DG Pass	DG/AG	
					Ratio Pass	Ratio Fail
High	80%	63%	20%	37%	1.27	1.85
Low	95%	87%	5%	13%	1.09	2.60

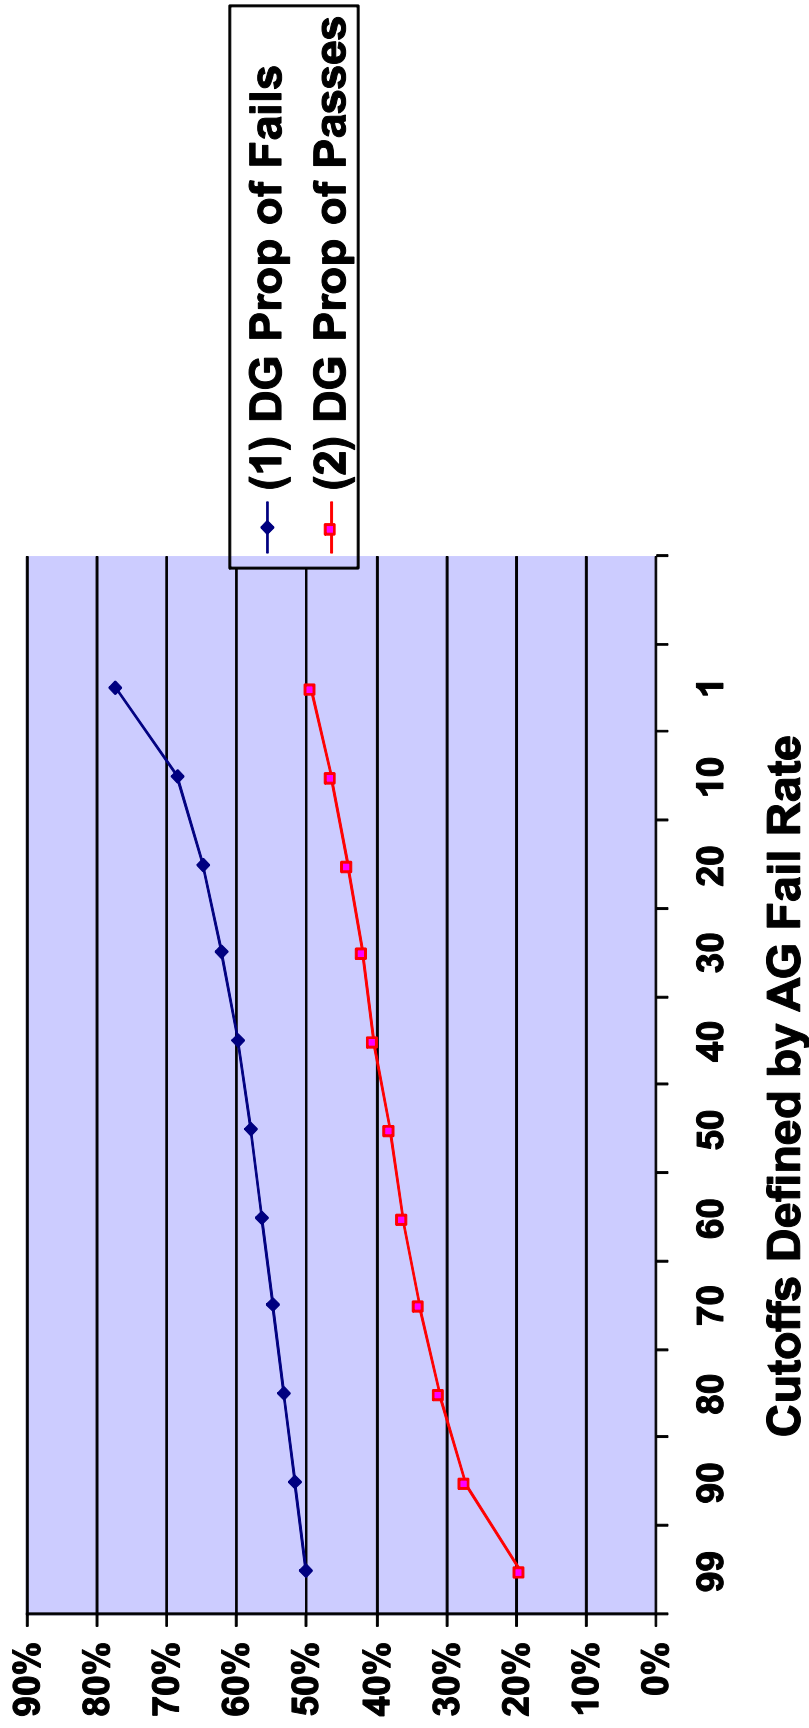

Corollary 1: Lowering the cutoff caused:

- (a) pass rates to increase by 38% for DG but only 19% for AG;
- (b) failure rates to decrease by 75% for AG but only 65% for DG.

Corollary 2: Lowering the cutoff t(assuming equal-sized groups) caused:

- (a) prop DG comprised of passes to increase from to 44% to 48%;
- (b) prop DG comprised of fails to increase from 65% to 72%.

Fig. 6. Proportion DG Comprises of (1) Persons Who Fail and (2) Persons Who Pass at Various Cutoff Points Defined by AG Fail Rate (where DG is half the population)

3 (bef)	100	89.2%	75.3%	10.8%	24.7%	1.18	2.29	13.9	2.71
4 (aft)	125	85.1%	69.0%	14.9%	31.0%	1.23	2.08	16.1	2.56

Question: Could one justify exploring the reasons for changes in any of the standard measures – say, to evaluate the role of a particular administration’s civil rights enforcement policy – without consideration of the patterns described here?

Estimated Effect Size (EES)

EES (Estimate Effect Size) Explained

- Derive from any pair of outcome rates the differences between means of the (hypothesized) underlying distributions in terms of standard deviations. In test score hypothetical EES was .50.
- Probit coefficient
- See [Solutions](#) subpage of Measuring Health Disparities page regarding limitations, nuances.

Table 10. Illustration of Effect on Standard Measures of Reducing Poverty Such as to Enable Everyone with and Income Above 75 Percent of Poverty Line to Escape Poverty (with EES)

Perc of Pov Line	Prop Wh Below	Prop Bl Below	B/W Ratio Below	W/B Ratio Above	Abs Df (PP)	Odds Ratio	EES
100	10.8%	24.7%	2.29	1.18	13.9	2.71	.55
75	7.2%	17.8%	2.47	1.13	10.6	2.79	.54

Table 11. White and Black Rates of Multiple Suspensions in Preschool and K-12, with Measures of Difference

Level	White Mult Susp Rate	Black Mult Susp Rate	B/W Ratio Susp	W/B Ratio No Susp	Abs Df (pp)	EES
Preschool	0.15%	0.67%	1.01	4.41	0.52	.49
K-12	2.23%	6.72%	1.05	3.01	4.49	.51

See Society 2014 at 15 re its Table 8 and [Preschool Disparities](#) subpage of Discipline Disparities page.

Table 12. Illustrations of EES Values

RR Adverse	DG Adverse Rt	AG Adverse Rt	EES	Percent of DG Above AG Mean
1.2	60.0%	50.0%	0.25	40.3%
1.2	18.4%	15.4%	0.12	45.4%
1.5	75.0%	50.0%	0.67	25.3%
1.5	45.0%	30.0%	0.39	35.0%
2	60.0%	30.0%	0.78	22.0%
2	40.0%	20.0%	0.58	28.3%
2	20.0%	10.0%	0.43	33.7%
2	1.0%	0.5%	0.24	40.9%
2.5	24.2%	9.7%	0.6	27.6%
2.5	7.2%	2.9%	0.43	33.7%
3	14.4%	4.8%	0.59	27.9%
3	2.7%	0.9%	0.43	33.7%

- With standard measure observers examine either:
 - (a) difference between AG and DG rates at different points in time or in different settings, or
 - (b) comparative changes of AG and DG rates over time or differing effects of factor on each rate
- Same holds for EES

Table 13. Illustration on the EES from Alternative Perspective (comparison of changes in AG and DG outcome rates rather than comparisons of difference between groups before and after change)

Table	Subject	Group	Initial Adverse Rate	Final Adverse Rate	Fav Perc Increase	Adv Perc Decrease	EES
2	Test	AG	20.0%	5.0%	18.8%	75.0%	0.80
2	Test	DG	37.0%	13.0%	38.1%	64.9%	0.80
8	Poverty	White	10.8%	7.2%	4.0%	33.3%	0.22
8	Poverty	Black	24.7%	17.8%	9.2%	27.9%	0.24

BLUE and RED Columns show Corollary 1 previously mentioned (in terms of relative change rather than rate ratio). EES is based on before and after rates. Since no meaningful change, EES should remain constant. That is, EES both for 20% versus 37%, and for 5% versus 13%, is .50. Compare with Tables on the [Educational Disparities](#) page and Table 7 of Society 2014 (Table 17 infra).

Interjection re subgroups

- [Subgroup Effects](#) subpage of SR explains why assuming that an intervention that reduces a baseline adverse outcome rate from 10% to 5% will cause a like 50% reduction in a baseline rate of 20% (i.e., to 10%) is not only incorrect but illogical. See also [Comment on Hingorani BMJ 2013](#) and [Illogical Premises, Illogical Premises II](#), and [Inevitability of Interaction](#) subpages SR.
- But one can, on the basis of the .36 EES difference reflected by the change from 10% to 5%, estimate that the intervention will reduce a 20% rate to approximately 11.5%.

The National Center for Health Statistics Response to IR1 and Other Health Disparities Research Issues

NCHS Response to IR1

- In five official and unofficial documents between 2004 and 2009 (responding to Society 2000 and Chance 1994), NCHS statisticians recognized that determinations of whether health and healthcare disparities were increasing or decreasing would commonly turn on whether one examined relative differences in favorable outcome or relative differences in adverse outcomes.
- Key document: 2005 NCHS monograph “Methodological Issues in Measuring Health Disparities”
- Agency merely recommended that all disparities be analyzed in terms of relative differences in adverse outcomes. Has never addressed the implications of the fact that measures change as the prevalence of an outcome changes with respect to the utility of the measures.
- See Society 2014 at 4 to 9.

Healthy People 2010 Technical Appendix at A-8

“Those dichotomous objectives that are expressed in terms of favorable events or conditions are re-expressed using the adverse event or condition for the purpose of computing disparity [12 [sic],18,19], but they are not otherwise restated or changed.”

13. Keppel KG, Pearcy JN, Klein RJ. Measuring progress in Healthy People 2010. Statistical Notes, no. 25. Hyattsville, MD: National Center for Health Statistics. September 2004.
18. Keppel KG, Pamuk E, Lynch J, et al. Methodological issues in measuring health disparities. National Center for Health Statistics. Vital Health Stat 2(141). 2005.
19. Keppel KG, Pearcy JN. Measuring relative disparities in terms of adverse outcomes. J Public Health Manag Pract 11(6). 2005.

Note: Few readers of the Technical Appendix would imagine that by measuring things like immunization disparities in terms of relative differences in no immunization one commonly reverses the direction of change over time, at times causing dramatic decreases to be dramatic increases (as in the Morita study in Table 14 infra).

CDC and AHRQ

- CDC usually measures disparities in terms of absolute differences between rates.
- AHRQ seeks to measure disparities in terms of relative differences in adverse outcomes, but does not invariably do so (see Table 4 of [FCSM 2013 presentation](#)).
- Neither CDC nor AHRQ has shown any awareness that measure change because prevalence changes or even that NCHS (an arm of CDC) has found that determinations of directions of change will commonly turn on which relative difference observer examines.
- Has the disparities research of NCHS, CDC, AHRQ (including the yearly National Healthcare Disparities Report) been of value?

5	1997	Post	46%	33%	1.39	1.24	13
9	1996	Pre	46%	32%	1.44	1.26	14
9	1997	Post	89%	84%	1.06	1.45	5

Table 14(d): Illustration Based on Morita (*Pediatrics* 2008) Data on Black and White Hepatitis-B Vaccination Rates Before and After School-Entry Vaccination Requirement

Grade	Year	Period	Wh Vac Rate	Bl Vac Rate	W/B Ratio Vac (Morita)	BW Ratio No Vac (NCHS)	Abs Df (PP) (CDC)	OR	EES
5	1996	Pre	8%	3%	2.67	1.05	5	2.81	47
5	1997	Post	46%	33%	1.39	1.24	13	1.73	34
9	1996	Pre	46%	32%	1.44	1.26	14	1.81	37
9	1997	Post	89%	84%	1.06	1.45	5	1.54	24

Table 15. Illustration from Harper et al. (CEBP 2009) Data on Differences in Mammography by Income (see [Comment on Harper](#))

Year	High Inc Mam Rt	Low Inc Mam Rt	H/L Ratio Mam	L/H Ratio No Mam	Abs Df (pp)	OR	EES
1987	36.3%	17.2%	2.11	1.30	19	2.74	0.60
2004	77.4%	55.2%	1.40	1.98	22	2.78	0.62

Abstract: “In contrast, relative area-socioeconomic disparities in mammography use increased by 161%.”

Text: “Whether a health outcome is defined in favorable or adverse terms (e.g., survival versus death) can affect the magnitude of measures of health disparity based on ratios (11, 12). Consistent with the Healthy People 2010 framework for comparing across outcomes (13), we measured all breast cancer outcomes in adverse terms.”

Relative difference for mammography decreased 64% (111% to 4%); relative difference for no mammography increased by 227%. (3% to 98%)

Table 16. Illustration from Baker and Middleton (JECH 2003) Data on Differences in Mammography of Least and Most Deprived (see [Mortality and Survival](#) page)

Year	Lst Dpr Mam Rt	Mst Dpr Mam Rt	LD/MD Ratio Mam	MD/LD Ratio No Mam	Abs Df (pp)	Odds Ratio	EES
1991	84.1%	39.0%	2.15	3.83	45	8.26	1.27
1999	98.6%	76.0%	1.30	17.14	23	22.24	1.49

Authors would rely on relative differences in mammography rates to find a decreased disparity.

Harper et al. would find a **570% increase** in the disparity (from 283% to 1714%).

NCHS and AHRQ – would call these either a **1331 percentage point increase** (NCHS) or **1331% increase** (AHRQ), referring to the increase from 283% to 1714%).

CDC would call it a **22 percentage point increase**.

Table 17. Illustration from Albain (J Nat Cancer Inst 2009) Data on Survival Rates of White and Black Women for Various Types of Cancers, from Albains et al., with Disparities Measures

Type	Wh Surv Rate	Bl Surv Rate	W/B Ratio Surv	B/W Ratio Mort	Abs Df (pp) *	Odds Ratio	EES
premenopausal breast cancer	77%	68%	1.13	1.39	9	1.58	0.27
postmenopausal breast cancer	62%	52%	1.19	1.26	10	1.51	0.26
advanced ovarian cancer	17%	13%	1.31	1.05	4	1.37	0.18
advanced prostate cancer	9%	6%	1.50	1.03	3	1.55	0.21

Studies finding larger relative differences in survival for more survivable cancers (or among the young) are really about relative differences in mortality. See [Mortality and Survival page Mortality/Survival Illustration](#) subpage of [Scanlan's Rule](#) page.

Table 18. Rates of Births Attended by Skilled Persons for Highest and Lowest Income Quintiles in Columbia and Bangladesh, from WHO Handbook on Health Inequality Monitoring (2013), with Disparities Measures

Country	Highest Quintile Attend Rate	Lowest Quintile Attend Rate	H/L Ratio Attend (WHO)	L/H Ratio No Attend (NCHS)	EES
Columbia	99.4%	83.7%	1.19	27.17	1.34
Bangladesh	50.6%	4.9%	10.33	1.93	1.67

WHO Handbook cites the 2005 NCHS monograph and seems to think it is following it. But relying on relative differences between attendance rates (BLUE) finds largest disparity for seven countries examined where NCHS would find smallest disparity (RED), and vice versa, with starkly different interpretations as to size .

Spurious Contradictions

- **1. Escarce and McGuire APHA 2004**

- racial differences in uncommon (increasing) procedures outcomes 1986-1997
- found usually **decreasing relative differences** in receipt (but would have found usually increasing absolute differences)

- **2. Jha et al. NEJM 2005**

- similar to no. 1 but for period 1992 to 2001
- found **usually increasing absolute differences** (but would have found usually decreasing relative differences in receipt)

- **3. Trivedi et al. NEJM 2005**

- examined racial differences in common (increasing) outcomes
- found **usually decreasing absolute differences**

- **4. Le Cook et al. Med Care Res and Rev 2008**

- titled “Measuring Trends in Racial/Ethnic Health Care Disparities”
- relied on absolute differences in things it reported
- Regarding studies 1 and 2 stated: *“The methods and data in [Jha et al.] were the same as Escarce and McGuire, except for the partial overlap in time periods. Assembly of a longer time series in Medicare would be necessary to reconcile the apparent differences in the findings of the two studies.”*

See [Spurious Contradictions](#) subpage of MHD.

Discrimination Issues

and

Demonstration That There Is Only One
Correct Answer Regarding Whether
the Forces Causing Outcome Rates of
AG and DG to Differ Are Stronger in
One Situation than Another

Table 19(a) : Varying Appraisals of the Comparative Degree of Employer Bias Using Different Measures of Disparities in Selection/Rejection Rates

Employer/ Setting	AG Sel Rate	DG Sel Rate	(1) AG/DG Ratio Selection
A	20.0%	9.0%	2.22 (1)
B	40.1%	22.7%	1.77 (2)
C	59.9%	40.5%	1.48 (3)
D	90.0%	78.2%	1.15 (4)

Approach 1 (relative favorable) (BLUE): A,B,C,D

Table 19(b) : Varying Appraisals of the Comparative Degree of Employer Bias Using Different Measures of Disparities in Selection/Rejection Rates

Employer/ Setting	AG Sel Rate	DG Sel Rate	(1) AG/DG Ratio Selection	(2) DG/AG Ratio Rejection
A	20.0%	9.0%	2.22 (1)	1.14 (4)
B	40.1%	22.7%	1.77 (2)	1.29 (3)
C	59.9%	40.5%	1.48 (3)	1.48 (2)
D	90.0%	78.2%	1.15 (4)	2.18 (1)

Approach 1 (relative favorable) (BLUE): A,B,C,D

Approach 2 (relative adverse) (RED): D,C,B,A (opposite of Approach 1)

Table 19(c) : Varying Appraisals of the Comparative Degree of Employer Bias Using Different Measures of Disparities in Selection/Rejection Rates

Employer/ Setting	AG Sel Rate	DG Sel Rate	(1) AG/DG Ratio Selection	(2) DG/AG Ratio Rejection	(3) Abs Diff (pp)
A	20.0%	9.0%	2.22 (1)	1.14 (4)	11 (4)
B	40.1%	22.7%	1.77 (2)	1.29 (3)	17(2)
C	59.9%	40.5%	1.48 (3)	1.48 (2)	19 (1)
D	90.0%	78.2%	1.15 (4)	2.18 (1)	12 (3)

Approach 1 (relative favorable) (BLUE): A,B,C,D

Approach 2 (relative adverse) (RED): D,C,B,A (opposite of Approach 1)

Approach 3 (absolute difference) (GREEN): C,B,D,A

Table 19(d) : Varying Appraisals of the Comparative Degree of Employer Bias Using Different Measures of Disparities in Selection/Rejection Rates

Employer/ Setting	AG Sel Rate	DG Sel Rate	(1) AG/DG Ratio Selection	(2) DG/AG Ratio Rejection	(3) Abs Diff (pp)	(4) Odds Ratio
A	20.0%	9.0%	2.22 (1)	1.14 (4)	11 (4)	2.53 (1)
B	40.1%	22.7%	1.77 (2)	1.29 (3)	17(2)	2.29 (3)
C	59.9%	40.5%	1.48 (3)	1.48 (2)	19 (1)	2.19 (4)
D	90.0%	78.2%	1.15 (4)	2.18 (1)	12 (3)	2.50 (2)

Approach 1 (relative favorable) (BLUE): A,B,C,D

Approach 2 (relative adverse) (RED): D,C,B,A (opposite of Approach 1)

Approach 3 (absolute difference) (GREEN): C,B,D,A

Approach 4 (odds ratio) (ORANGE): A,D,B,C (opposite of Approach 3)

- Is one employer more biased as to selection while another more biased as to rejection?
- Is one more biased in relative terms and another more biased in absolute terms?
- There can be only one reality as to the comparative ranking.

- Which is the correct ranking?
- As all rows are based on the same specifications as Table 2 and Figures 1 to 3 (EES = .5), there is no rational basis for distinguishing among them.
- Any measure that does distinguish among them is a flawed measure.

Table 20. Appraisals of the Differences in Outcome Disparities for AG and DG Applicants with Low and High Qualifications

Row #	Applicant Qualification	AG Sel Rate	DG Sel Rate	AG/DG Ratio Selection	DG/AG Ratio Rejection	Abs Diff (pp)	Odds Ratio
1	Very Low	20%	9%	2.22	1.14	11	2.53
2	Low	40%	22.7%	1.77	1.29	17	2.29
3	High	59%	40.5%	1.48	1.48	19	2.19
4	Very High	90%	78.2%	1.15	2.18	12	2.50

Note: Some observers would read the smaller relative difference in selection rates (BLUE) among the highly qualified applicants (rows 3 and 4) as evidence that employers are less likely to rely on stereotypes when there are objective indicators of qualifications.

Table 21. Illustration of Contrasting Interpretations of Effects of Convictions on Callback Rates of Applicants by Race (based on Pager 2003)

Race	No Conviction (AG) CB Rt	Conviction (DG) CB Rt	AG/DG Ratio Ratio CB	DG/AG Ratio No CB	EES
White	34%	17%	2.00	1.26	0.54
Black	14%	5%	2.80	1.10	0.56

Note: This table reflect the alternative perspective (comparison of a factor's effects on different groups). Author drew inferences based on comparative size of relative differences in favorable outcomes (blue field). See the [Criminal Record Effects](#) subpage of SR for racial differences among those with and without criminal records and a later study with rather different results.

Illustration of Subsidiary Point 1 (Invalidity of Representational Comparisons)

Table 22. Illustration of Problematic Nature of Representational Comparisons

DG Proportion of Pool	DG Proportion of Selections	AG/DG Ratio Selection
20%	10%	2.25
30%	20%	1.71
50%	30%	2.33
10%	5%	2.11
50%	25%	3.00

We cannot appraise the comparative likelihood that bias was involved because we cannot determine the actual selection rates. We need those to derive the EES.

Disproportionality in Special Education

Assignment or Discipline

- IDEA Data Center (IDC) Disproportionality Guide's Four Measures (see [IDEA Data Center Disproportionality Guide](#) subpage of Discipline Disparities page)
 - Rate comparisons
 - (a) relative differences in assignment rates
 - (b) absolute differences in assignment rates
 - Representational comparisons
 - (c) relative difference between proportion DG comprises of pool and proportion DG comprises of those assigned
 - (d) absolute difference between proportion DG comprises of pool and proportion DG comprises of those assigned

Table 23(a). Effects of Prevalence of Outcome on Measures from IDC Guide for Identifying “Significant Disproportionality” in Special Education

(1) DG Prop Pool	AG Adv Rate	DG Adv Rate	(a) DG/AG Ratio Adv Rate
20%	20%	36.7%	1.83
20%	10%	21.8%	2.18
20%	3%	8.4%	2.79
70%	20%	36.7%	1.83
70%	10%	21.8%	2.18
70%	3%	8.4%	2.79

See [IDEA Data Center Disproportionality Guide](#) subpage of Discipline Disparities page.
 Implications of circumspection and review.

Table 23(b). Effects of Prevalence of Outcome on Measures from
 IDC Guide for Identifying “Significant Disproportionality” in
 Special Education

(1) DG Prop Pool	(a)			(b) Abs Df Btw Rates (pp)
	AG Adv Rate	DG Adv Rate	DG/AG Ratio Adv Rate	
20%	20%	36.7%	1.83	16.7
20%	10%	21.8%	2.18	11.8
20%	3%	8.4%	2.79	5.4
70%	20%	36.7%	1.83	16.7
70%	10%	21.8%	2.18	11.8
70%	3%	8.4%	2.79	5.4

Fig. 7. Proportion DG Comprises of (1) Persons Who Fail at Various Cutoff Points Defined by AG Fail Rate (where DG is half the population)

Cutoffs Defined by AG Fail Rate

This is an abbreviated version of Figure 6, which was used to illustrate Corollary 2 to IR1. The figure is used here to show that as an adverse outcome declines in prevalence, the proportion DG comprises of persons experiencing the outcome increase, and, hence, as shown in Table 23(c) and 23(d) *infra*, the relative and absolute differences between the proportion DG comprises of the pool and the proportion DG comprises of the persons experiencing the adverse outcome both increase.

Table 23(c). Effects of Prevalence of Outcome of Measures from IDC Guide for Identifying “Significant Disproportionality” in Special Education (b5618a1)

(1) DG Prop Pool	AG Adv Rate	DG Adv Rate	(a) DG/AG Ratio Adv Rate	(b) Abs Df Btw Rates (pp)	(2) DG Prop of Adv
20%	20%	36.7%	1.83	16.7	31.4%
20%	10%	21.8%	2.18	11.8	35.2%
20%	3%	8.4%	2.79	5.4	41.1%
70%	20%	36.7%	1.83	16.7	81.1%
70%	10%	21.8%	2.18	11.8	83.6%
70%	3%	8.4%	2.79	5.4	86.7%

See [IDEA Data Center Disproportionality Guide](#) subpage of Discipline Disparities page.

Table 23(d). Effects of Prevalence of Outcome of Measures from IDC Guide for Identifying “Significant Disproportionality” in Special Education

(1) DG Prop Pool	AG Adv Rate	DG Adv Rate	(a) DG/AG Ratio Adv Rate	(b) Abs Df Btw Rates (pp)	(2) DG Prop of Adv	(c) Rel Df Bwt (1) and (2)	(d) Abs Df Btw (1) and (2)
20%	20%	36.7%	1.83	16.7	31.4%	57.2%	11.4
20%	10%	21.8%	2.18	11.8	35.2%	76.2%	15.2

70%	10%	21.8%	2.18	11.8	83.6%	19.4%	13.6
70%	3%	8.4%	2.79	5.4	86.7%	23.9%	16.7

See [IDEA Data Center Disproportionality Guide](#) subpage of Discipline Disparities page.

Summary Re IDC

Disproportionality Measures

General reductions in assignment rates tend to:

- (a) increase relative difference in assignment rates (IR1)
- (b) reduce absolute differences in assignment rates (IR2)
- (c) increase relative differences between DG proportion of pool and DG proportion of those assigned (Corollary 2 to IR1)
- (d) increase absolute difference between DG proportion of pool and DG proportion of those assigned (Corollary 2 to IR1)

- We can, however, draw sound inferences on the basis of the rates of assignment of AG and DG (EES).
- We cannot draw sound inferences on the basis of the proportion DG comprises of pool and the proportion it comprises of persons assigned because we can only interpret the actual outcome rates.

- A further problem with the measures of differences between the proportion DG comprises of the pool and the proportion DG comprises of those experiencing an outcome, such as measures (c) and (d) in IDC guide, is that result is affected by the proportion DG comprises of the pool in a way that is unrelated to the strength of the forces causing the rates to differ, as illustrated in Table 23(d) and 24.
- But this is nuance of an measure that is unsound for other reasons.

Table 23(d). Effects of Prevalence of Outcome of Measures from IDC Guide for Identifying “Significant Disproportionality” in Special Education (b5618a1)

(1) DG Prop Pool	AG Adv Rate	DG Adv Rate	(a) DG/AG Ratio Adv Rate	(b) Abs Df Btw Rates (pp)	(2) DG Prop of Adv	(c) Rel Df Bwt (1) and (2)	(d) Abs Df Btw (1) and (2)
20%	20%	36.7%	1.83	16.7	31.4%	57.2%	11.4
20%	10%	21.8%	2.18	11.8	35.2%	76.2%	15.2
20%	3%	8.4%	2.79	5.4	41.1%	105.6%	21.1
70%	20%	36.7%	1.83	16.7	81.1%	15.8%	11.1
70%	10%	21.8%	2.18	11.8	83.6%	19.4%	13.6
70%	3%	8.4%	2.79	5.4	86.7%	23.9%	16.7

See [IDEA Data Center Disproportionality Guide](#) subpage of Discipline Disparities page.

Table 24. Effects of DG Representation in Pool on Measures from IDC Guide for Identifying “Significant Disproportionality” in Special Education

(1) DG Prop Pool	AG Adv Rate	DG Adv Rate	(a) DG/AG Ratio Adv	(b) Abs Df Btw Rates (pp)	(2) DG Prop of Adv	(c) Rel Df Bwt (1) and (2)	(d) Abs Df Btw (1) and (2)
20%	10%	21.8%	2.18	11.8	35.2%	76.2%	15.24
30%	10%	21.8%	2.18	11.8	48.2%	60.9%	18.27
40%	10%	21.8%	2.18	11.8	59.2%	48.0%	19.20
50%	10%	21.8%	2.18	11.8	68.5%	37.1%	18.52
60%	10%	21.8%	2.18	11.8	76.6%	27.6%	16.56
70%	10%	21.8%	2.18	11.8	83.6%	19.4%	13.55
80%	10%	21.8%	2.18	11.8	89.7%	12.1%	9.70

Pay for Performance Issues

Summary re Pay for Performance (P4P)

- Reliance on absolute differences to measure healthcare disparities led to (a) perception in US (where increasing uncommon outcomes were examined) that P4P would tend to increase disparities and (b) perception in UK (where increasing uncommon outcomes were examined) that P4P would tend to reduce disparities.
- Perception in US led Massachusetts to include a disparities element in its Medicaid P4P program, but to employ a measure that is more likely to increase than reduce disparities.

Table 25: Illustration Based on Werner et al. (*Circulation* 2005) Data on White and Black CABG Rates Before and After Implementation of CABG Report Card (see [Comment on Werner](#))

Period	Wh Rt	BI Rt	W/B Ratio CABG	B/W Ratio No CABG	Abs Df (pp)	Odds Ratio	EES
1	3.6%	0.9%	4.00	1.03	2.70	4.11	0.58
2	8%	3%	2.67	1.05	5.00	2.81	0.48

Rather than find decreasing disparities according to the relative differences in receipt of CABG (BLUE) (as was probably the most common approach at the time), authors rely on absolute difference (GREEN) to find incentive program increases disparities. Study causes numerous researchers to recommend including disparities measure in P4P programs.

Table 26. Illustration of Changes in Absolute Differences over Time to Low Frequency Outcomes (A) and High Frequency Outcomes (B) (Re Pay for Performance)

Outcome – Time	AG Fav Rt	DG Fav RT	Abs Df (pp)
A – Year One	20%	9%	11
A – Year Two	30%	15%	15
B – Year One	80%	63%	17
B – Year Two	90%	78%	12

Increases in low frequency favorable outcomes (A) tend to increase absolute differences; increases in high frequency favorable outcomes (B) tend to increase absolute differences.

Table 27. Illustration of Absolute Differences at Low and High Performing Hospital as to Low Frequency Outcomes (A) and High Frequency Outcomes (B) (Re Pay for Performance)

Hospital–Outcome	AG Fav Rt	DG Fav RT	Abs Df
Low Performing – A	20%	9%	11
High Performing – A	30%	15%	15
Low Performing – B	80%	63%	17
High Performing – B	90%	78%	12

Red highlighted rows reflect situation of Massachusetts Medicaid pay-for-performance program. See [Between Group Variance subpage of Measuring Health Disparities](#) page, pages 32 to 34 of the [FCSM 2013 Research Conference paper](#), and pages 10 to 12 of [“Race and Mortality Revisited.”](#)

Educational Disparities Issues

Table 28. Varying Interpretations of Effects of Educational Improvements on Difference in Falling Below Basic and Reaching Advanced Level

Row No.	AG Fav Rate	DG Fav Rate	AG/DG Ratio Fav (McKinsey)	DG/AG Ratio Adv (McKinsey)	Abs Diff (pp) (EdTrust)
1	10%	3.8%	2.67	1.07	0.06
2	20%	9.0%	2.22	1.14	0.11
3	80%	63.3%	1.26	1.83	0.17
4	90%	78.2%	1.15	2.17	0.12

Movement from Row 1 to Row 2 reflects increases in rates of reaching the advanced level; movement from Row 3 to Row 4 reflects increases in rates of reaching basic level.

Observers relying on absolute differences [GREEN] would tend to find (a) increase in former but (b) decrease in latter (approach in study discussed in [Education Trust Glass Ceiling Study](#) subpage of Educational Disparities page).

Observers relying on larger absolute difference [BLUE for 1 to 2; RED for 3 to 4] would tend to find (a) decrease in the former but (b) increase in the latter (as in study discussed in the [McKinsey Achievement Gap Study](#) subpage of the Educational Disparities page).

Additional Illustrations of
Pernicious Notion That All
Measures are Sound – From
Alternative Perspective

Table 29. Illustration of Change in Standard Measures of Increase in Poverty Such as to Pull Into Poverty Everyone with and Below 125 Percent of Poverty Line (alternative perspective)

Group	Initial Pov Rate	Final Pov Rate	Perc Fav Decrease	Perc Adv Increase	Abs Df (pp)	EES
White	10.8%	14.9%	4.6%	38.0%	4.1	0.20
Black	24.7%	31.0%	8.4%	25.5%	6.3	0.19

Same as Table 8, but from the alternative perspective. Those relying on relative measures would say poverty increased more for whites, while those relying on absolute differences would say poverty increased more for blacks.

**Table 30. Patterns of in Changes in Unemployment Rates by Race and Ethnicity
(from 2011 Center for American Progress study)**

Race	2007 Unempl Rate	2011 Unempl Rate	Perc Dec Employ	Perc Inc Unemploy	Abs Change (pp)	EES
Black	8.6%	15.8%	7.9%	83.7%	7.2	0.36
Hispanic	5.8%	12.9%	7.5%	122.4%	7.1	0.44
White	4.2%	8.7%	4.7%	107.1%	4.5	0.37
